Ericsson gifts the UN
26/12/2001*And the United Nations has formally accepted the GSM mobile communications system that will support its humanitarian operations.*

In this festive spirit of giving, Ericsson has generously bestowed the United Nations (UN) with a brand new end-to-end GSM mobile telecommunications system, including network equipment, both hardware and software, and handsets. The entire works will complement the UN's satellite network based at their telecommunications centre in Brindisi, Italy.

To add icing to the cake, the network provider will install, test, train and provide remote support over a period of two years, all for free.

The initiatives are made through the company's Corporate Citizenship programme, Ericsson Response, which offers effective support and rapid response to human tragedy caused by disasters. The disaster support team, comprising of highly skilled telecommunications staff and technology, works closely with leading humanitarian relief organizations to offer quicker and more efficient aid in times of need.

The effort is a global one as Ericsson develops local disaster preparedness programmes across all its offices worldwide and in close cooperation with international aid agencies such as the UN and the International Federation of Red Cross and Red Crescent Societies.
